

Assignment 5 Reflection

Student: Vineesh Cutting | **Roll number:** RSI2026505

Status: 200-word draft grounded in the actual agent-assisted platform session. Codex operated Safari with permission; the student approved the Prism paragraph revision. The student should review this reflection before submission. It is not presented as an independently written personal account.

Reflection Draft

Converting the smart-farming review into LaTeX demonstrated that scientific fidelity requires more than successful compilation. The workflow retained twelve equations, two tables, the architecture figure, twenty references, and the existing review structure. Native mathematics and automatic references improved editability, while comparison against the original remained essential.

Codex operated my authenticated Prism and Overleaf accounts with permission. Prism checked equation signs, labels, bibliography keys, table layout, and figure paths. Its debugging explanations confirmed earlier local corrections rather than revealing new platform failures. One actual local error arose from blank lines inside an equation environment; removing those lines resolved it without changing mathematics.

The unchanged Prism export compiled successfully in Overleaf on its first attempt. Both outputs contained thirteen pages, with a minor bibliography spacing message requiring inspection rather than scientific revision. Preserving the first export and compiler logs made this portability claim auditable. I subsequently approved Prism's clearer calibration paragraph, while retaining its distinctions and confounding mechanisms.

AI assistance was useful for bounded conversion, consistency checks, and explanation, but it did not establish scientific validity. Researchers must independently verify citations, units, assumptions, and evidence boundaries, distinguish illustrative calculations from measurements, carefully inspect final outputs, and remain responsible for the submitted work.
